

Fossil Fuels : Significant, but Harmful

I never knew that I was involved in helping Global Warming, until now. I also didn't know that everybody in the entire Earth was involved in this dramatic issue that had been going on for years now. People are consistently burning this important fuel for ourselves, and we can't stop unless everybody in the Earth agrees to find another eco-free ways to save the Earth than keep burning fossil fuels. Fossil fuel is a famous type of energy but also helpful and harmful to many people of living, but we can figure out another way that would be very efficient. So now, lots of fuels are burned today, about 15 billion kg a year and the whole world uses about 84% of the energy we use! We have to feel guilty and try our best for a better life for us!!!

To start, you might wonder, what are fossil fuels? Fossil fuels are an energy source made of the remains of organisms that lived millions of years ago. "Fossil" the word itself means the remains of organisms and "fuels" means, material is burned to produce heat or power, together, they mean the energy made from the remains of organisms. Fossil fuels are all below where we live. It could even be below where we are! Remember, this fuel is the broad name for energy source because there are lots of kinds of fossil fuels, so let's find out!

Around the 1880s, coal was first used, which is one of a kind of fossil fuels. Now, these fuels are used to heat homes, factories, transportation and generally, they are used for electricity. Other than famous coal, petroleum and natural gas are mostly used in our life. Nevertheless, that doesn't mean that we can't change this problem,

only that it would take a long time to fix it by replacing anti-fossil fuel electricity and another way. As you know, fossil fuels emit greenhouse gasses. Such as Carbon Dioxide, which is the opposite of what we breathe! Additionally, fossil fuel is non-renewable, which means after you use it, you can't recycle it! Even worse, it pollutes the ocean, air and humans. So, this famous, harmful fuel leads to illnesses which sorrows people. Also, humans would have stresses of living because of global warming mostly caused by fossil fuels. Ultimately, it would pollute innocent lands, water, and even us! To clarify, this energy source could lead to land-fills and waste, which is, again, harmful to the Earth and us. So, there should be a cause of this problem, one of it is that it's very clear is maybe because of increasing populations. The more there are the populations, the more fossil fuels would be used! Thus, we have to make some changes in order to live without varies of illnesses and stresses.

Therefore, if we use too much fossil fuels, like what we are doing right now, then it would absolutely help global warming. Fossil fuels are a problem that is hard to change. However, the only helpful start *we* could do about it is to save the world! Before you save the world, never think, "My one act can't save the world!!" because if you do, it doesn't mean that you are the only one thinking about it. I know that it is such a cliché, we need to save electricity, water, food, buy less plastic and ride cars less. Speaking of riding cars, there are electric cars that'll help the world, but they actually aren't 100% eco-friendly right now. The reason why is that some electric cars' batteries are made out of fossil fuels and the batteries that are all used up could get recycled up to 99%. But scientists are still working on it today, so we can't be sure to that. Simultaneously, solar panels have the same problem, but still, the energy is coming from the sun, which is more eco-friendly than fossil fuels! Last but importantly, the station that loves the world is the wind power station. It creates electricity by the wind, which is helpful and harmless to people. Therefore, because

we have people engineering and caring for the world, we need to do it together. Fossil fuel is significant but harmful, so we need to help our gigantic house. Thank you.
